PHYSICS 495 RESEARCH PROJECT

“Physics in Psychology”

Jonathan Richard Flynn

Physics, University of North Carolina Wilmington

Abstract

The purpose of this presentation is a general review of the many applications of physics in the field of psychology. Many contemporary avenues of research in psychology directly study the living brain, which was very difficult until recent advances in imaging techniques. A brief overview of these techniques and the physics behind them will be given, along with a short segment on the biophysics of the brain.
