Real US Gross Domestic Product Growth Rates

Real US Gross Domestic Product Growth Rates (Quarterly Change at an Annual Rate)

The US Economic Outlook

- Sustained “modest” growth
- Low inflation
- Federal Reserve easing?
Sustained Modest Growth

• No acceleration back to trend
• Pickup expected during the second half of 2013
  – Business investment
  – Housing
  – The labor market will likely generate 190,000-200,000 jobs per month with an accompanying slow fall in the unemployment rate.
• Federal, state and local government spending will be reduced in line with what is sustainable over the long run given the slowdown in potential GDP growth based upon labor force and productivity trends.
Low Inflation

• The PCE (personal consumption expenditure) deflator remains in the 1-1.5% range.
  – Below any sort of trigger for Federal Reserve action

• Interest rates on many “safe” instruments remain low.
  – The yield on the benchmark 10-year US Treasury bond is likely to stay below 2% for at least the next six months.
Consumers

• Sentiment
  – The University of Michigan index of consumer sentiment has strengthened to the highest level of the current recovery.

• Credit
  – Consumer credit, excluding mortgages, is up almost 6% over last year.
    • Driven by non-revolving credit, particularly educational and auto loans
    • Revolving credit is only up slightly more than 1%.
  – As the economy continues to improve and households and lenders feel more secure in consumers’ income prospects (lower default risk), consumer credit should continue to grow.
US Unemployment Rate

US Employment

• The Bureau of Labor Statistics (BLS) July 2013 Employment Situation Summary showed that employment rose by 195,000 in June 2013.
  – Employment rose in leisure and hospitality, professional and business services, retail trade, health care, and financial activities.
• The number of unemployed people (11.8 million) and the national unemployment rate were unchanged from June 2013 (7.6%).
  – Both measures have shown little change since February 2013.
  – The number of long-term unemployed (unemployed for ≥ 27 weeks) was essentially unchanged at 4.3 million.
    • 36.7% of total unemployment
    • The number of long-term unemployed has declined by 1.0 million over the past twelve months.
• Employers have created an average of 202,000 jobs a month this year, up from 180,000 in the previous six months.

“Unsettling” US Employment Changes in June 2013

• A relatively large proportion of the June 2013 gains in nonfarm payroll employment was in lower-paying sectors, namely, leisure and hospitality (+ 75,000 jobs) and retail trade (+ 37,000 jobs).
  
  – When added to temporary services and home health care employment gains, a total of 128,300 jobs were created by these four sectors, accounting for almost 2/3 of all jobs created.

• These four sectors comprise only 0.09% of total nonfarm employment.
US Employment Changes in June 2013 (cont.)

- Employment in many higher-paying sectors has weakened.
  - Manufacturing
    - Manufacturing employment fell by 6,000, with most of the fall in nondurable goods.
    - Manufacturing employment has fallen for five consecutive months.
    - Aggregate hours worked in manufacturing did not change appreciably.
  - Manufacturing is likely bearing the brunt of the global economic slowdown, which has reduced export growth.
  - Businesses employed in distribution (e.g., railroads, trucking firms, shipping firms, and storage and warehousing businesses) also reduced employment.
US Manufacturing

- Despite the widely held view that US manufacturing is in decline, the industrial sector remains an important sector.
  - However, the same cannot be said about manufacturing employment.
    - In the late 1970s, manufacturing employed one out of five workers (20%).
      - At its height in June 1979, manufacturing employed 19.5 million.
- Manufacturing processes have become more capital intensive.
  - There is less need for labor.
    - Manufacturing now employs around 12 million (down 39% from June 1979).
  - Skill requirements for labor employed in manufacturing have risen.
  - These shifts are necessary for the US to maintain global competitiveness.
- Over 2009-early 2013, NC was 16th in the nation in manufacturing job creation.
The Federal Reserve

• The Federal Reserve System has consistently placed a high value on data pertaining to manufacturing and related sectors.
  – The information is timely and rarely revised substantially.

• With the loss in growth momentum, will the Federal Reserve System continue the quantitative easing (QE) wind-down?
  – Possibly beginning in September

• In his testimony before the House Financial Services Committee on July 17, 2013, Chairman Bernanke stated that the Fed will hold its target interest rate (the federal funds rate) near zero as long as the unemployment rate is above 6.5%.
  – The Fed could hold the rate at its current level even if the rate falls below 6.5%, particularly if the rate falls because unemployed workers leave the labor force.
Policy Uncertainty and Sequestration

- Given higher taxes, ongoing policy uncertainty, and $44 billion of sequestration currently scheduled for FY 2013, growth prospects for the first half of 2013 will likely be at a below-average pace of around 2.5%.
- The US economy should be able to withstand these effects (*code for no likely recession*) given continued strength in housing, solid motor vehicle sales activity, and a possible rise in exports as growth abroad gradually improves.
