- Paranoia
- Headache
- Dizziness
- Insomnia
- Mouth dryness
- Suppressed appetite
- Diarrhea or constipation
- Impotence or changes in sex drive

The term "**study drugs**" refers to prescription drugs used to increase concentration and stamina for the purpose of studying or cramming.

Study drugs are **prescription stimulant medications** that are used improperly by a person with a prescription, or more often, illegally by a person without a prescription.

These medications treat **Attention Deficit Hyperactivity Disorder (ADHD)**, which affects attention span, impulse control, self-discipline, and hyperactivity in the case of ADHD.

Possession of just one tablet of an unprescribed stimulant is a **felony** (possible jail and loss of financial aid)

*Though it can feel like cramming & stress are essential for success - there are other ways of reaching your goals.*
