

EXAMPLE OF HEADINGS:

PROJECT DESCRIPTION (1st Order)

Background (2nd Order)

The Cape Fear River between Wilmington and Cape Fear is located on the approximate axis of the Cape Fear Arch. Although the river occupies Holocene sediments, from the area of about Wilmington south to Bald Head Island, the channel cuts through the Holocene into sediments and rocks ranging in age from Cretaceous to Oligocene. Cretaceous units are discussed below.

Cape Fear Formation (3rd Order)

The Cape Fear Formation is the oldest Cretaceous unit to crop out in the North Carolina Coastal Plain. It is best exposed along the Cape Fear River and its tributaries in the inner Coastal Plain in the vicinity of Fayetteville, NC. The Cape... ..
